Cambio de estudio NF1 c.3362A>G (chr17:3123274 A/G, rs757222815 o NM_000267.3:c.3362A>G)

Exón 26 y 27 e intrones adyacentes:

Se ha descrito que este cambio causa la formación de dos transcritos: (1) conteniendo la sustitución y (2) con *skipping* del exón 20. La mutación resulta en la presencia de una isoforma del mRNA con el *splicing* correcto, conteniendo el cambio *missense* correspondiente (p.Glu1121Gly), y otra donde pierde el exón 20¹.

El cambio se encuentra en la primera línea del exón 26 (la **a** en color rojo subrayada en amarillo).

Se va a obtener los resultados que produce analizar esta variable con los diferente predictores y ver cuál de ellos es más preciso.

Según el artículo, el cambio de interés está en el exón 20. Sin embargo, el cambio anotado como c.3362A>G en NF1 está en el exón 26, por lo que trabajaremos con este.

Desaparece un sitio aceptor (en rojo) en la secuencia mutada, coincidiendo con la posición de interés. Sin embargo, este sitio no se utiliza en el *splicing* de la secuencia *wild type*, por lo que no tendrá influencia sobre el proceso.

taggtgatttttcagctgt**ag**ggaagtggttggcaccacta 1153 1193 0.76 taggtgatttttcagctgt**ag**ggaagtggttggcaccacta

No hay cambios entre las predicciones para la secuencia *wild type* y la mutada, por lo que no tendrá efecto en el *splicing*.

GENSCAN → no da resultados para este cambio

1153 1193

0.76

MaxEntScan

MAXENT: -42.21 MDD: -27.71 MM: -28.63 WMM: -22.26 MAXENT: -7.42 MM: -7.61 WMM: -8.09

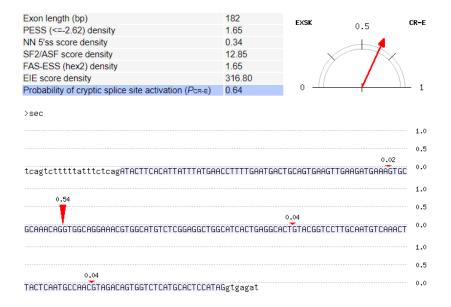

En los resultados tanto para 5'SS (izquierda) como 3'SS (derecha), las puntuaciones son muuy bajas y negativas, por lo que no debe estar afectando al *splicing*.

Spliceman

| Point mutation | Wildtype (wt) | Mutation (mt) | L1 distance | Ranking (L1) |
|-----------------|---------------|---------------|-------------|--------------|
| agttg(a/g)agatg | tgaaga | tggaga | 25976 | 49% |

En el análisis de la región adyacente al cambio, se obtiene una puntuación no muy elevada (49%) para el cambio A>G, por lo que puede estar afectando al *splicing*.

CRYP-SKIP

Parece que hay varios sitios crípticos de *splicing* dentro del propio exón, pero el cambio de interés no lo toma en consideración, por lo que no debe considerar que tenga algún efecto en el *splicing*.

Desaparece un BP en la secuencia mutada, justo el que incluye la posición de interés, por lo que no es probable que haya una alteración del *splicing* porque está dentro del exón y tiene puntuación negativa.

IntSplice

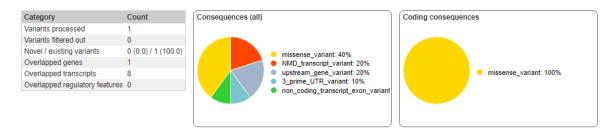

SNV at chr17:3123274 can't be predicted by IntSplice.

Prediction shows either Abnormal or Normal.

Prediction Genomic Mutation Ensembl 64 Transcript ID and Exon No.

Input queries: hg19, chr17, 3123274

Variant Effect Predictor tool

Se trata de una variante que está afectando al sitio de *splicing*, por lo que va a provocar que se altere el *splicing* normal. Esto se observa porque el resultado dice que es una variante NMD, lo que quiere decir que está activando un proceso que solo se da para degrada mRNAs mal generado. Además, dice que es una variante *missense*, lo que generará un cambio en la proteína.

ESEfinder

De los resultados donde se encuentra la posición de interés, en cuanto a los sitios de *splicing*, tiene puntuación positiva en las matrices de 5'SS en un único resultado (AAGTTGAAGATGAAAGTGCGCAAACAGGTG) con puntuaciones 4.26180 y 4.56120, pero también da una puntuación positiva en un único resultado (TTTGAATGACTGCAGTGAAGTTGAAGATGA) en las matrices de 3'SS (0.44860 y 0.18690). Si vamos a los resultados equivalentes en la secuencia mutada, para la primera, los valores casi no se han visto alterados (4.41830 y 4.72050), igual que en la segunda, aunque haya aumentado un poco más (0.83560 y 0.52410). Por lo tanto, no se pueden sacar conclusiones para ninguno.

Si buscamos los ESE de la secuencia, para la puntuación de interés, solo hay un fragmento con esta que tiene puntuación positiva en más de una matriz: AAGATGA (1.31395 y 0.07210). El equivalente en la secuencia mutada tiene puntuaciones más altas en esas mismas matrices (2.24182 y 0.30965) por lo que el cambio puede tener un efecto de alteración de este sitio en el *splicing*.

Mutation(s) E+42A>T, E+98C>G and E+13A>T have the highest probability of exon skipping.

La posición de estudio está marcada en rosa fuerte, por lo que puede estar implicada en el *splicing* (0.25).
